Setting the mood - the darker side of designer radiators

Vasco showcases their range of black designer radiators:

Introducing the range of elegant and sophisticated black designer radiators from Vasco, the market leader in Belgium and now available in the UK. The trend for monochrome has ignited the imagination and these radiators are now becoming a statement item. The contrast between a lighter background and dark-through-to-black furniture, fabrics and other essential elements can be introduced into living rooms, kitchens and bathrooms, creating an ambience unique to each setting.

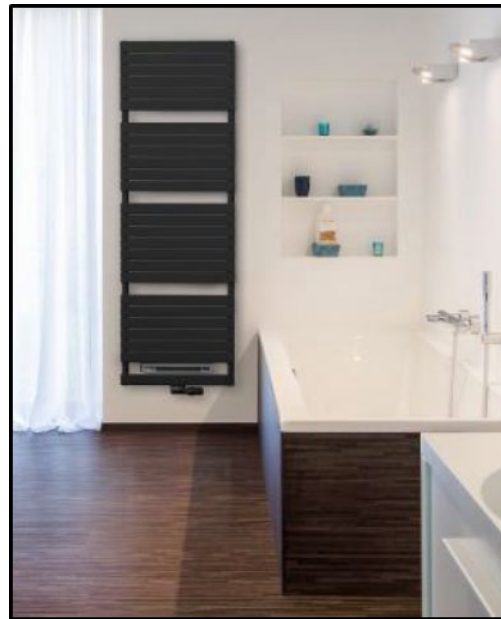

Oni (below) and Niva (left) both radiators shown with a colour coordinated centre connection

The clearly defined lines and flat fronts of the Oni and Niva models create the impression that they are quite literally floating near the surface of the wall. The Oni, with its gentle shape and rounded edges make this aluminium radiator unmistakable. At only eight millimetres wide it's the most slender radiator Vasco has ever produced; both Oni and Niva radiators are perfect for a wide range of interiors styles from a minimal, pared-back, puristic space through to a more traditional classic living area.

Other designer radiators from Vasco including the Aster (above left), Viola (above right), Zana, Carré or Tulipa are available in black, providing a multitude of options to introduce individuality into a rooms design.

The icing on the cake of this new collection is the matching valve set in jet black (RAL 9005) perfecting the visual appearance of the black designer radiators. The coherent unit of radiator and fitting is reinforced as no weld seams are visible and the valves are discreetly integrated into the body.

Many designer radiators from Vasco, such as the Oni are made entirely of lightweight, highly resistant, recycled aluminium. Stable, flexible and with a solid profile, it has excellent thermal conductivity for optimal heat dissipation; all the aluminium radiators are manufactured with a patented press connection following this they receive a cathaphoretic primer, protecting against any form of corrosion; finally they are electrostatically coated with a high-quality epoxy-polyester powder coating.

Oni has already received several awards for sustainable design and future viability. The most important recent industry and design awards: the IF Design Award in the “Building / Technology” product category and the seal of approval from the “Design Plus” jury at ISH.
