

Double Valve Connector

Description

The Vasco Easy Flow® air duct system, combined with Vasco ventilation units, creates a unique low-noise ventilation system. A limited number of components and a smart logistical concept ensure quick and hassle-free installation. The Vasco Easy Flow® air duct system is manufactured from durable HDPE. Installation is fast, simple and flexible.

The Easy Flow Double Valve Connector enables pressure losses in the air duct system to be reduced by connecting two Vasco Easy Flow® air ducts in parallel to a single air valve.

These ducts run from the plenum and merge in the double valve connector, which is then connected to a straight or angled valve connection piece with a single valve.

This makes it possible, among other things, to cover longer distances and to reduce the number of valves in larger spaces.

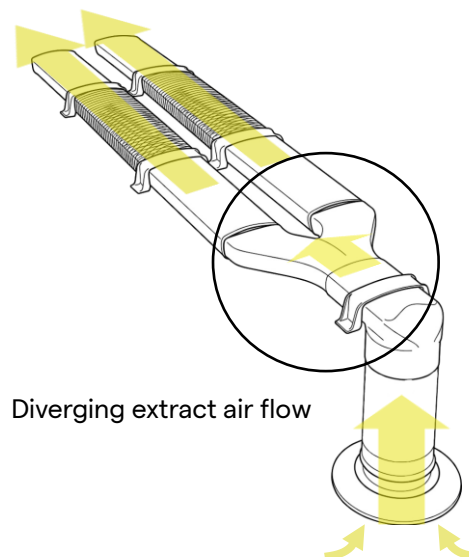

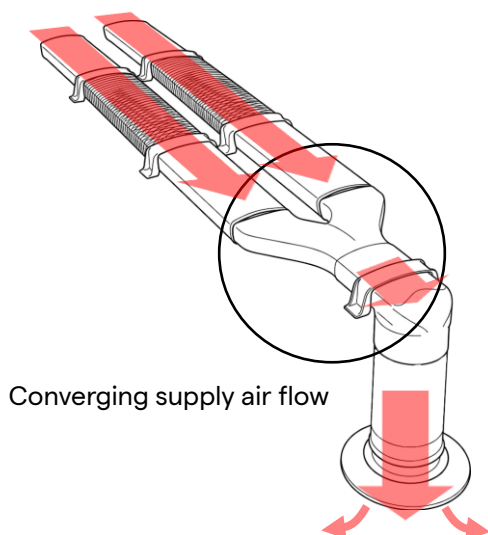

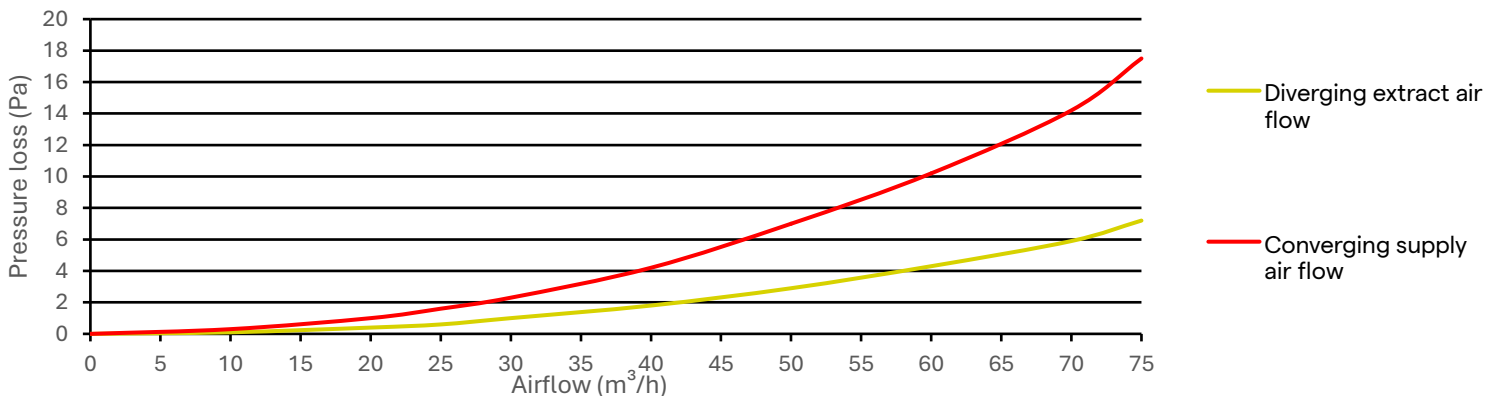

The connector is not intended to split a single duct into multiple valves and must therefore not be used as a branch or Y-piece in the duct system.

- Includes rubber seals
- Supplied per piece
- Material: HDPE (High Density Polyethylene)
- Airtightness class according to NEN-EN 1507 & NEN-EN 12237: D
